

Wide

FamilyID	Age1	Age2	Age3
1	9	6	3
2	8	6	2
3	6	4	2

Turn Wide Data into Long Data

- **Step 1: Turn Wide Data into Long Data**
- Open your dataset in SPSS.
- Go to **Data** → **Restructure**.
- In the **Restructure Data Wizard**:
 - Choose “**Restructure selected variables into cases**” → Click **Next**.
- Select your ID variable: **FamilyID** → Click **Next**.
- Select the variables to be transposed (the repeated measures): **Age1, Age2, Age3** → Click **Next**.
- Specify the **name for the new variable** that will hold the values: e.g., **Age**.
- Optionally, create a variable to indicate which measure it was (e.g., **AgeNumber**) → Click **Next**.
- Click **Finish**.

Long

FamilyID	AgeNumber	Age
1	1	9
1	2	6
1	3	3
2	1	8
2	2	6
2	3	2
3	1	6
3	2	4
3	3	2

From Long back to Wide

Step 2: Turn Long Data Back into Wide Data

- With the long dataset open, go to **Data → Restructure**.
- Choose “**Restructure selected cases into variables**” → Click **Next**.
- Select the **ID variable: FamilyID** → Click **Next**.
- Choose the **variable that defines new variables** (the measure indicator): **AgeNumber** → Click **Next**.
- Select the **variable that holds the values: Age** → Click **Next**.
- Click **Finish**.

Back to Original Wide Format

FamilyID	Age1	Age2	Age3
1	9	6	3
2	8	6	2
3	6	4	2
